PCP for NEXP

So far we constructed PCPs for NP:

$$NP \subseteq PCP [\varepsilon_c = 0, \varepsilon_s = 0.5, \Sigma = \{0,1\}, l = \exp(n), q = O(1), r = \text{poly}(n)]$$

$$NP \subseteq PCP [\varepsilon_c = 0, \varepsilon_s = 0.5, \Sigma = \{0,1\}, l = \text{poly}(n), q = \text{poly}(\log n), r = O(\log n)]$$

Today we construct a PCP for NEXP:

Theorem: $NEXP \subseteq PCP [\varepsilon_c = 0, \varepsilon_s = 0.5, \Sigma = \{0,1\}, l = \exp(n), q = \text{poly}(n), r = \text{poly}(n)]$

Remarks:

- $l = \exp(n)$ is the correct regime since the witness and computation have size $\exp(n)$
 - $q = \text{poly}(n)$ is exponentially smaller than witness and computation size
[as we see later in the course, one can even achieve $q = O(1)$!]
 - the PCP verifier runs in $\text{poly}(n)$ time, exponentially smaller than original computation!
- ↑ this is the first instance of "verification faster than computation" that we see for PCPs!

Towards Sublinear Verification

To achieve **sublinear verification** we must

- ① consider a problem where $|description| \ll |computation|$
- ② design a PCP verifier that only uses description (does not "unroll" the computation)

① We have seen examples when constructing IPs for "large classes":

Ex: in **#SAT** we are given a boolean formula $\phi: \{0,1\}^n \rightarrow \{0,1\}$ and $v \in \mathbb{N}$, and must check

$$|\{a \in \{0,1\}^n \mid \phi(a) = 1\}| \stackrel{?}{=} v$$

Ex: in **TQBF** we are given a boolean formula $\phi: \{0,1\}^n \rightarrow \{0,1\}$ and must check

$$\forall x_1 \exists x_2 \forall x_3 \dots \phi(x_1, \dots, x_n) \stackrel{?}{=} 1$$

In both cases the description has size $|\phi|$ but the "computation" has size $2^n \cdot |\phi|$.

In our lectures on PCPs we have **not yet considered** such problems.

We have built PCPs for NP-complete problems where **$|description| \sim |computation|$** :

$$QESAT(\mathbb{F}) = \{ (p_1, \dots, p_m) \mid \exists a \in \mathbb{F}^n \text{ s.t. } p_1(a) = \dots = p_m(a) = 0 \}$$

$$RCS(\mathbb{F}) = \{ (v, A, B, C) \mid \exists z \in \mathbb{F}^n \text{ s.t. } Az + Bz = Cz \text{ \& } z = (v, w) \text{ for some } w \}.$$

Towards Sublinear Verification

To achieve **sublinear verification** we must

- ① consider a problem where $|description| \ll |computation|$
- ② design a PCP verifier that only uses description (does not "unroll" the computation)

② The PCPs that we designed so far operate on the computation, not the description:

PCP for QESAT(\mathbb{F})

$$P((p_1, \dots, p_m), a) :=$$

1. For every $t \in H_e^{S_e}$:
 - $p_r = T(p_1, \dots, p_m; r)$
 - $\Pi_{sc}[r] :=$ eval table for sumcheck to show $p_r(a) = 0$
 - output $\Pi_{sc}[r]$
2. output $\hat{a} : \mathbb{F}^{S_v} \rightarrow \mathbb{F}$
[LDE of $a : [n] \rightarrow \mathbb{F}$]

$$V((p_1, \dots, p_m)) :=$$

1. Sample $r \in H_e^{S_e}$ and compute

$$p_r := \sum_{0 \leq j_1, \dots, j_{S_e} < |H_e|} r_{j_1}^{j_1} \dots r_{j_{S_e}}^{j_{S_e}} \cdot p_{j_1 \dots j_{S_e}}$$
2. run sumcheck to check that

$$\sum_{\alpha, \beta \in H_v^{S_v}} \hat{C}_r(\alpha, \beta) \hat{a}(\alpha) \hat{a}(\beta) = 0$$

$$V_{sc}(\mathbb{F}, H_v, 2S_v, 0)$$

3. run low-degree test on Π_a
 $V_{LDT}(\mathbb{F}, S_v, S_v | H_v|)$

Computing p_r and evaluating \hat{C}_r takes $\text{poly}(m, n)$ time even if (p_1, \dots, p_m) have "structure"

A NEXP-Complete Problem

[1/2]

$$\text{def: } \text{OSAT} := \left\{ (m, n, \phi) \mid \begin{array}{l} m, n \in \mathbb{N} \text{ and } \phi: \{0,1\}^{m+3n+3} \rightarrow \{0,1\} \text{ is a boolean formula s.t.} \\ \exists A: \{0,1\}^n \rightarrow \{0,1\} \text{ for which} \\ \forall w \in \{0,1\}^m \forall v_1, v_2, v_3 \in \{0,1\}^n \quad \phi(w, v_1, v_2, v_3, A(v_1), A(v_2), A(v_3)) = 0 \end{array} \right\}.$$

claim: OSAT is NEXP-complete

proof: Suppose $L \in \text{NEXP}$ and let M be a NEXP machine deciding L .

Let x be an input to M . By the **Cook-Levin Theorem**, there is a 3CNF Φ_x s.t.

① Φ_x is satisfiable iff M accepts x

② Φ_x has $N_v = 2^{\text{poly}(|x|)}$ variables and $N_c = 2^{\text{poly}(|x|)}$ clauses — set $n := \log N_v$

③ there is a $\text{poly}(|x|)$ -size circuit $D_x: \{0,1\}^{3n+3} \rightarrow \{0,1\}$ that specifies Φ_x 's clauses:

$$D_x(v_1, v_2, v_3, c_1, c_2, c_3) = 1 \quad \text{iff} \quad \Phi_x \text{ contains clause } \bigvee_{i=1}^3 (x_{v_i} \oplus c_i)$$

Therefore, $x \in L$ iff $\exists A: \{0,1\}^n \rightarrow \{0,1\}$

$$\forall v_1, v_2, v_3 \in \{0,1\}^n \quad \forall c_1, c_2, c_3 \in \{0,1\} \quad D_x(v_1, v_2, v_3, c_1, c_2, c_3) \wedge \overline{\left(\bigvee_{i=1}^3 A(v_i) \oplus c_i \right)} = 0$$

A NEXP-Complete Problem

[2/2]

$$\text{def: } \text{OSAT} := \left\{ (m, n, \phi) \mid \begin{array}{l} m, n \in \mathbb{N} \text{ and } \phi: \{0,1\}^{m+3n+3} \rightarrow \{0,1\} \text{ is a boolean formula s.t.} \\ \exists A: \{0,1\}^n \rightarrow \{0,1\} \text{ for which} \\ \forall w \in \{0,1\}^m \forall v_1, v_2, v_3 \in \{0,1\}^n \phi(w, v_1, v_2, v_3, A(v_1), A(v_2), A(v_3)) = 0 \end{array} \right\}.$$

claim: OSAT is NEXP-complete

proof: [continued]

Therefore, $x \in L$ iff $\exists A: \{0,1\}^n \rightarrow \{0,1\}$

$$\forall v_1, v_2, v_3 \in \{0,1\}^n \forall c_1, c_2, c_3 \in \{0,1\} \quad \underline{D_x(v_1, v_2, v_3, c_1, c_2, c_3) \wedge \left(\bigvee_{i=1}^3 A(v_i) \oplus c_i \right)} = 0$$

Finally, to make D_x a formula, apply the **Cook-Levin Theorem** to D_x to get a boolean formula $\psi: \{0,1\}^{m'+3n+3} \rightarrow \{0,1\}$ of size $\text{poly}(|D_x|) = \text{poly}(|x|)$ such that

$$D_x(v_1, v_2, v_3, c_1, c_2, c_3) = 1 \quad \text{iff} \quad \exists w' \in \{0,1\}^{m'} \quad \underline{\psi(w', v_1, v_2, v_3, c_1, c_2, c_3) = 1}$$

Now define

$$\phi(w, v_1, v_2, v_3, a_1, a_2, a_3) := \underline{\psi(w', v_1, v_2, v_3, c_1, c_2, c_3) \wedge \left(\bigvee_{i=1}^3 a_i \oplus c_i \right)}$$

where $w = (w', c_1, c_2, c_3) \in \{0,1\}^m$ and $m := m' + 3$.

Part 1: Arithmetization of OSAT

claim: there is a polynomial-time transformation T s.t.

- ① $T(\mathbb{F}, (m, n, \phi))$ outputs a circuit $\hat{\phi}: \mathbb{F}^{m+3n+3} \rightarrow \mathbb{F}$ of total degree $|\phi|$
- ② $(m, n, \phi) \in \text{OSAT}$ iff \exists multilinear $\hat{A}: \mathbb{F}^n \rightarrow \mathbb{F}$ s.t. \hat{A} is boolean on $\{0, 1\}^n$ and $\forall w \in \{0, 1\}^m \forall v_1, v_2, v_3 \in \{0, 1\}^n \quad \hat{\phi}(w, v_1, v_2, v_3, \hat{A}(v_1), \hat{A}(v_2), \hat{A}(v_3)) = 0$

"zero on subcube" testing

proof:

The transformation T outputs $\hat{\phi} := \text{arithmetize}(\mathbb{F}, \phi)$.

[Recall: $x \wedge y \mapsto x \cdot y$, $x \vee y \mapsto 1 - (1-x)(1-y)$, $\bar{x} \mapsto 1-x$.]

This ensures that the total degree of $\hat{\phi}$ is $\leq |\phi|$ and $\hat{\phi} \equiv \phi$ on every boolean input.

Completeness: if $A: \{0, 1\}^n \rightarrow \{0, 1\}$ is a witness for $(m, n, \phi) \in \text{OSAT}$ then $\hat{A} =$ "multilinear extension of A " satisfies the booleanity condition and the vanishing condition

Soundness: if $(m, n, \phi) \notin \text{OSAT}$ then \forall multilinear $\hat{A}: \mathbb{F}^n \rightarrow \mathbb{F}$ either \hat{A} is not boolean on $\{0, 1\}^n$ or $\exists w \in \{0, 1\}^m \exists v_1, v_2, v_3 \in \{0, 1\}^n \quad \hat{\phi}(w, v_1, v_2, v_3, \hat{A}(v_1), \hat{A}(v_2), \hat{A}(v_3)) = \phi(w, v_1, v_2, v_3, \hat{A}(v_1), \hat{A}(v_2), \hat{A}(v_3)) \neq 0$

Part 2: Zero-on-Subcube Test

[1/2]

Given oracle access to a low-degree $f: \mathbb{F}^n \rightarrow \mathbb{F}$, check that $f|_{H^n} \equiv 0$.

Idea: reduce to sumcheck

Let $\text{int}: H \rightarrow \{0, 1, \dots, |H|-1\}$ be an efficiently computable bijection.

Consider the polynomial $g(x_1, \dots, x_n) := \sum_{a_1, \dots, a_n \in H} f(a_1, \dots, a_n) X_1^{\text{int}(a_1)} \dots X_n^{\text{int}(a_n)}$.

If $f|_{H^n} \equiv 0$ then $g \equiv 0$.

If $f|_{H^n} \not\equiv 0$ then $g \neq 0$, and in particular $\Pr_{r_1, \dots, r_n \in \mathbb{F}} [g(r_1, \dots, r_n) = 0] \leq \frac{n \cdot (|H|-1)}{|\mathbb{F}|}$.

Hence it suffices to check that $\sum_{a_1, \dots, a_n \in H} f(a_1, \dots, a_n) r_1^{\text{int}(a_1)} \dots r_n^{\text{int}(a_n)}$ for random $r_1, \dots, r_n \in \mathbb{F}$.

To make the addend a polynomial: $\forall r \in H$ define $\hat{r}(x) := \sum_{a \in H} r^{\text{int}(a)} L_{a,H}(x)$.

In sum it suffices to run sumcheck on this claim:

$$\sum_{a_1, \dots, a_n \in H} f(a_1, \dots, a_n) \hat{r}_1(a_1) \dots \hat{r}_n(a_n) \quad \text{for random } r_1, \dots, r_n \in \mathbb{F}.$$

Part 2: Zero-on-Subcube Test

[2/2]

$$f|_{H^n} \stackrel{?}{=} 0$$

$$P(\mathbb{F}, H, n, f)$$

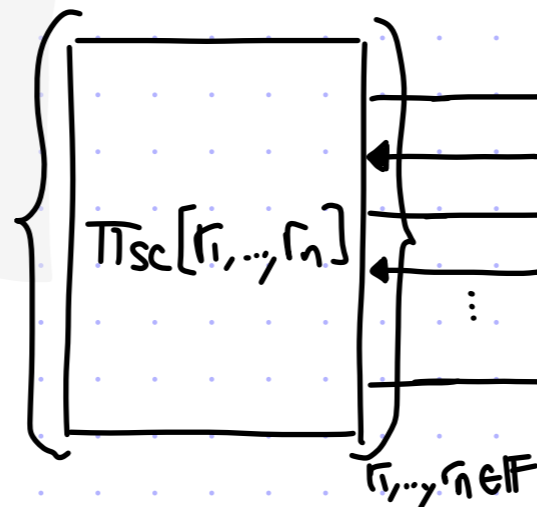

For every $r_1, \dots, r_n \in \mathbb{F}$:

output eval table $\Pi_{sc}[r_1, \dots, r_n]$
of IP prover for sumcheck claim

$$\sum_{a_1, \dots, a_n \in H} f(a_1, \dots, a_n) \prod_{i \in [n]} \hat{r}_i(a_i) = 0$$

proof length:

$$\begin{aligned} |\Pi_{sc}| &= |\mathbb{F}|^n \cdot O(|\mathbb{F}|^n \cdot (|H|+d)) \\ &= |\mathbb{F}|^{O(n)} \cdot (|H|+d) \end{aligned}$$

$$\forall f: \mathbb{F}^n \rightarrow \mathbb{F} \quad (\mathbb{F}, H, n)$$

Sample $r_1, \dots, r_n \in \mathbb{F}$.

Run sumcheck for the claim

$$\sum_{a_1, \dots, a_n \in H} f(a_1, \dots, a_n) \prod_{i \in [n]} \hat{r}_i(a_i) = 0$$

query complexity:

- $O(n \cdot (|H|+d))$ elts from Π_{sc}
- 1 elt from f

running time:

- $\text{poly}(n, |H|, d)$ from V_{sc}
- $\text{poly}(n, |H|)$ from

$$(s_1, \dots, s_n) \quad f(s_1, \dots, s_n) \cdot \prod_{i \in [n]} \hat{r}_i(s_i)$$

1. query f at (s_1, \dots, s_n)

2. for $i=1, \dots, n$: evaluate $\hat{r}_i(x)$ at s_i

Completeness: if $f|_{H^n} \equiv 0$ then $\forall r_1, \dots, r_n \in \mathbb{F} \quad \sum_{a_1, \dots, a_n \in H} f(a_1, \dots, a_n) \prod_{i \in [n]} \hat{r}_i(a_i) = 0$ so V_{sc} accepts w.p. 1

Soundness: if $f|_{H^n} \not\equiv 0$ then, except w.p. $\leq \frac{n \cdot (|H|-1)}{|\mathbb{F}|}$ over $r_1, \dots, r_n \in \mathbb{F}$, $\sum_{a_1, \dots, a_n \in H} f(a_1, \dots, a_n) \prod_{i \in [n]} \hat{r}_i(a_i) \neq 0$
so V_{sc} accepts w.p. $\leq \frac{n \cdot (|H|-1+d)}{|\mathbb{F}|}$.

Putting the Two Parts Together

$$P((m, n, \phi), A)$$

0. Compute $\hat{\phi} := T(F, (m, n, \phi))$ for $|F| = \text{poly}(|\phi|)$.

1. Output $\pi_A: F^n \rightarrow F$ that equals the multilinear extension of $A: \{0,1\}^n \rightarrow \{0,1\}$

2. For every $r_1, \dots, r_n \in F$:

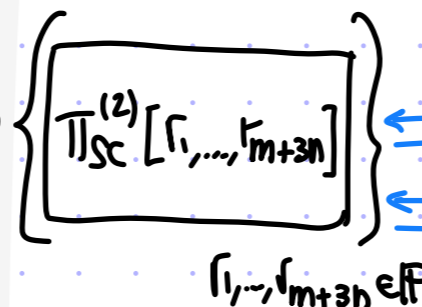

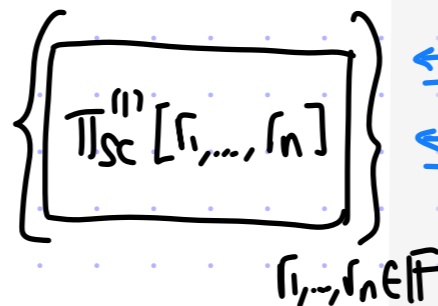

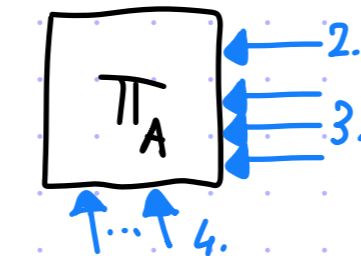

output sumcheck proof $\pi_{sc}^{(1)}[r_1, \dots, r_n]$

$$\text{for } \sum_{a \in \{0,1\}^n} \pi_A(a) (1 - \pi_A(a)) \prod_{i \in [n]} \hat{r}_i(a_i) = 0$$

3. For every $r_1, \dots, r_{m+3n} \in F$:

output sumcheck proof $\pi_{sc}^{(2)}[r_1, \dots, r_{m+3n}]$

$$\text{for } \sum_{a=(w,v_1,v_2,v_3) \in \{0,1\}^{m+3n}} \hat{\phi}(w, v_1, v_2, v_3, \pi_A(v_1), \pi_A(v_2), \pi_A(v_3)) \prod_{i \in [m+3n]} \hat{r}_i(a_i) = 0$$

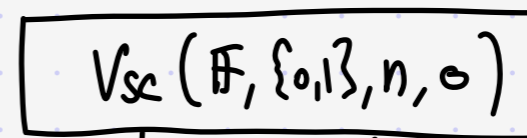

$$V((m, n, \phi))$$

1. Compute $\hat{\phi} := T(F, (m, n, \phi))$ for F of size $\text{poly}(|\phi|)$

2. Sample $r_1, \dots, r_n \in F$ & run sumcheck for claim

$$\sum_{a \in \{0,1\}^n} \pi_A(a) (1 - \pi_A(a)) \prod_{i \in [n]} \hat{r}_i(a_i) = 0$$

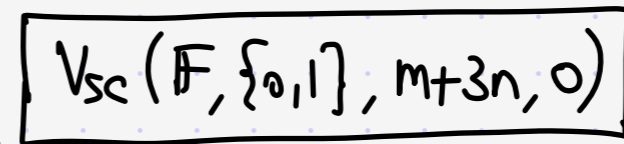

(s_1, \dots, s_n)

- query π_A at (s_1, \dots, s_n)
- for $i=1, \dots, n$: eval $\hat{r}_i(x)$ at s_i

3. Sample $r_1, \dots, r_{m+3n} \in F$ & run sumcheck for claim:

$$\sum_{a=(w,v_1,v_2,v_3) \in \{0,1\}^{m+3n}} \hat{\phi}(w, v_1, v_2, v_3, \pi_A(v_1), \pi_A(v_2), \pi_A(v_3)) \prod_{i \in [m+3n]} \hat{r}_i(a_i) = 0$$

$a=(w,v_1,v_2,v_3) \in \{0,1\}^{m+3n}$

(s_1, \dots, s_{m+3n})

- query π_A at $(s_{m+1}, \dots, s_{m+n}), (s_{m+n+1}, \dots, s_{m+2n}), (s_{m+2n+1}, \dots, s_{m+3n})$
- for $i=1, \dots, m+3n$: eval $\hat{r}_i(x)$ at s_i
- evaluate $\hat{\phi}$ at (s, ans_1, ans_2, ans_3)

4. low-degree test π_A for total degree n $\left[\begin{smallmatrix} \text{poly}(n) \\ \text{queries} \end{smallmatrix} \right]$

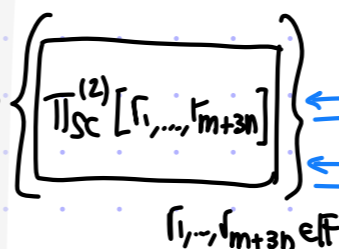

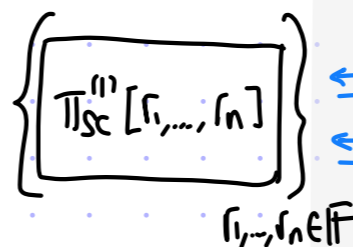

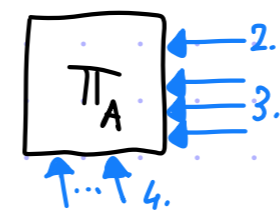

Analysis

$$P((m, n, \phi), A)$$

1. Output $\pi_A: \mathbb{F}^n \rightarrow \mathbb{F}$ that equals the multilinear extension of $A: \{0,1\}^n \rightarrow \{0,1\}$

2. For every $r_1, \dots, r_n \in \mathbb{F}$:
output sumcheck proof $\pi_{sc}^{(1)}[r_1, \dots, r_n]$
for $\sum_{a_1, \dots, a_n \in \{0,1\}} \pi_A(a) (1 - \pi_A(a)) \prod_{i \in [n]} \hat{r}_i(a_i) = 0$

3. For every $r_1, \dots, r_{m+3n} \in \mathbb{F}$:
output sumcheck proof $\pi_{sc}^{(2)}[r_1, \dots, r_{m+3n}]$
for $\sum_{a=(w,v_1,v_2,v_3) \in \{0,1\}^{m+3n}} \hat{\phi}(w, v_1, v_2, v_3, \pi_A(v_1), \pi_A(v_2), \pi_A(v_3)) \prod_{i \in [m+3n]} \hat{r}_i(a_i) = 0$

$$V((m, n, \phi))$$

1. Compute $\hat{\phi} := T(\mathbb{F}, (m, n, \phi))$ for \mathbb{F} of size $\text{poly}(|\phi|)$

2. Sample $r_1, \dots, r_n \in \mathbb{F}$ & run sumcheck for claim:

$$\sum_{a_1, \dots, a_n \in \{0,1\}^n} \pi_A(a) (1 - \pi_A(a)) \prod_{i \in [n]} \hat{r}_i(a_i) = 0$$

$$V_{sc}(\mathbb{F}, \{0,1\}, n, 0)$$

• query π_A at (s_1, \dots, s_n)
• for $i=1, \dots, n$: eval $\hat{r}_i(x)$ at s_i

3. Sample $r_1, \dots, r_{m+3n} \in \mathbb{F}$ & run sumcheck for claim:

$$\sum_{a=(w,v_1,v_2,v_3) \in \{0,1\}^{m+3n}} \hat{\phi}(w, v_1, v_2, v_3, \pi_A(v_1), \pi_A(v_2), \pi_A(v_3)) \prod_{i \in [m+3n]} \hat{r}_i(a_i) = 0$$

$$a=(w,v_1,v_2,v_3) \in \{0,1\}^{m+3n}$$

$$V_{sc}(\mathbb{F}, \{0,1\}, m+3n, 0)$$

$$(s_1, \dots, s_{m+3n})$$

• query π_A at $(s_{m+1}, \dots, s_{m+n}), (s_{m+n+1}, \dots, s_{m+2n}), (s_{m+2n+1}, \dots, s_{m+3n})$
• for $i=1, \dots, m+3n$: eval $\hat{r}_i(x)$ at s_i
• evaluate $\hat{\phi}$ at $(s, \text{ans}_1, \text{ans}_2, \text{ans}_3)$

4. low-degree test π_A for total degree n $\left[\begin{smallmatrix} \text{poly}(n) \\ \text{queries} \end{smallmatrix} \right]$

• soundness error:

$$\epsilon_{\text{LDT}} + O(1) + O\left(\frac{n \cdot n}{|\mathbb{F}|}\right) + O\left(\frac{(m+3n) \cdot (|\phi| \cdot n)}{|\mathbb{F}|}\right) \Rightarrow |\mathbb{F}| = \text{poly}(|\phi|) \text{ suffices}$$

• proof length:

$$\begin{aligned} & |\pi_A| + |\pi_{sc}^{(1)}| + |\pi_{sc}^{(2)}| \\ &= |\mathbb{F}|^n + |\mathbb{F}|^n \cdot O(|\mathbb{F}|^n \cdot 1) + |\mathbb{F}|^{m+3n} \cdot O(|\mathbb{F}|^{m+3n} \cdot |\phi|) \\ &= O(|\mathbb{F}|^{\text{poly}(m,n)}) = 2^{\text{poly}(m,n, \log|\phi|)} \end{aligned}$$

• query complexity:

$$\begin{aligned} & (1+3+q_{\text{LDT}}) + n \cdot O(1) + (m+3n) \cdot |\phi| \\ &= \text{poly}(n) + \text{poly}(|\phi|) \\ &= \text{poly}(|\phi|) \end{aligned}$$

• verifier time

$$\begin{aligned} & \text{poly}(|\phi|) + \text{poly}(n) + \text{poly}(|\phi|) + t_{\text{LDT}} \\ &= \text{poly}(|\phi|) \end{aligned}$$
